Viewing the existance of or viewing content of ??

To control all

make ftp root something like f:\ftproot

then make ftp vdirs

user1 for g:\ftpfolder\user1

user2 for g:\ftpfolder\user2

and make sure that the NTFS permissions on these physical folders are something like

administrators full, userX read write list

When a user then connects they will not see anything unless their g:\ftpfolder\userX is their home directory, and if it is not then the first thing they will need to do is to cd userX
