What is in the long run most simple is to use a new folder for this, as over time you will have more such files, or you will forget that there is a unique file within the folder.

However, what you can do is use the fact that an explicit grant takes control over an inherited deny.

So, if you want all Users to have Full control for all of the files in the folder, except for UserX who is a member of Users, then you could

Grant Full for Users

Deny Full for UserX and use the advanced tab to set this ACE to apply to Files Only

Then, on the file where UserX should be able to read edit the permission of that file and Grant UserX what access that account should have for the file.
