If this happens on more than one computer then maybe there is a problem with the roaming profile or locating the server where it is located. There is a Group Policy setting that will log user off if their roaming profile can not be loaded. It is under computer configuration/administrative templates/system logon. If it happens only on a particular computer and not for all users on that computer then maybe there are permission problems to the local profile folder or local profile corruption. If the user does not have permissions to userinit.exe for some reason they also will be logged off right away. --- Steve
