I believe if you are using dynamic disks you can usually expand the size but not the system drive which would probably be your C drive. Basic disks can not be expanded. You could simply move data folders or possibly even some applications [never move system files] to a new program files folder on the D drive. If you do such you will have to reconfigure the properties of the desktop shortcuts to point to the new drive and maybe let programs know where the data files have been moved to if they have a program associated with them. If moving an application does not allow it to work you may have to check the registry to see if there are keys that point to the original drive or uninstall and reinstall the application to the D drive. There are programs like Partition Magic that will let you change the size of your disk partitions. The links below may help. If you do decide to try and repartition your drive be sure to back up your critical data files to cdrom/dvd just in case the operation does not go as planned. Sometimes if you search your drive for temporary files [* .tmp] and look in your Windows temp folder [winnt\temp] you will be surprised at how much room you can gain by deleting them. If you have a high speed internet connection you should also review the size given to your temporary internet files and reduce from default. I use 40MB and it works fine for me. --- Steve
