Barry,

If you have built a security configuration editor template using the mmc snap-in "security templates" that carries the filesystem permissions you want everywhere, then you can import this into a GPO that has the machine to be imprinted within its GPO scope of application.

To build such a template, use also the mmc snap-in "security analysis and configuration" and import the template and then analyze on a reference machine until the template matches the desired filesystem settings. Each time you adjust the template values, save the template and then (re)import into the analyzer, choosing to clear the database each time, and (re)analyze.

A couple things are pre-requisite to this working are

1. you want permissions set the same on all machines using the same groups
2. the filesystem part you want controlled is the same on all the machines (same drive letter and path)
