

Identifying Service Accounts

As part of our annual E&Y audit, we have been told to make changes to the accounts that are service accounts (i.e. change their AD name, password, delete them, create new ones, etc). Well, easy for them to say! I first need to identify all the service accounts on all of our servers. How do I do that? The ADMT tool assumes NT to 2K. I tried to use it from domain A to domain A, but it doesn't like that. There's got to be another tool that isn't tied to migrations that will work for this purpose. Any ideas would be greatly appreciated. Thanks!

.
