Is it possible to implement Microsoft certificate services and also use PGP on the same smart card? I'm doing a research project for school, and my professor wants to know if I can incorporate PGP into MS Cert Services??

What I'm trying to find out is if I can store a pgp key in Active Directory also, or on the same card as I store X.509 Certificates used with a Microsoft PKI (cert services).

I'm doing a paper on cross platform authentication w/MS Cert Services and any feedback is greatly appreciated.

Thanks for your help guys!! ;)

JP
