Probably the best way is implement Group Policy Restricted Groups at the OU level for the computers you want this to happen on. See the link below for more details. I would create a global group and add it to "this group is a member of" for administrators at the OU level. Doing it at the OU level will prevent the users from being address to the administrators group for the domain assuming that domain controllers are not in the scope of management of that GPO at the OU level which they would not be if all are in the default domain controllers container. --- Steve
