It could be a problem with the VPN connection. If possible try to do the same on the local network where the FTP server is located to see if the problem still happens or not. VPN adds a lot of overhead and if the connection is already slow I have seen connectivity problems when I used to VPN into home from work. While you may have decent download speeds the uplink speeds can leave a lot to be desired. The logs on the FTP server may also show if there are problems with your user account trying to upload to it and lack of permissions or even it that command was received. If you have a personal firewall on your computer try disabling it to see if that makes a difference or not. --- Steve
