How can I create a local admin account with all administrator priviledges that cannot be seen or viewed by others. The reason for this is that our company insists on issuing all users of all computers admin priviledges so that they can install applications as needed, however many of these users like to change the administrator password on the local machines when they get their machines or just before they turn them into us when they are leaving the company, making it impossible for us to get into the machine and pull data off of it.

We run a Novell network, however we use a standard W2K Professional operating system as our client platform. It would be nice if we could create local Administrator account that another user with administrator access could not change the password for, or make this account invisible to all other users.

Any suggestions would be greatly appreciated and welcomed.
