Sure an ipsec policy can help. You can specify the IP addresses of the remote computers that can access it for specific ports/protocols. You can also use kerberos, certificate, or preshared key as forms of computer authentication. The link below explains more on the basics if ipsec. ---

I have Windows 2000 Server with SQL daatbase and erp application , how can
i
secure so that only few users can access in terms through network, ping.
Is there any way by which IPSEC can help me and wht configuration i need
to
do.
