cut/paste is a move  
copy/paste is a copy  
copy always caused new copy to have permissions  
as defined for copied-to location  
move acts just like copy if move is to a different partition  
if move is within one partition, move keeps explicit permissions  
originally on the moved, but (eventually) loses inherited  
permissions originally on the moved and obtains inherited  
permissions defined for the moved-to location

I recommend for pre-Vista versions that one always copy  
and then delete the original when wanting to move within  
a single partition.

Hi,

When a user cut and paste a file into a folder the file holds the user  
rights.

When a user copy and paste a file into a folder the file takes over the  
correct folder rights.

Does anyone know why and how to handle this?

Thx
