Did you check to see if it was still enabled? The link below shows how if you are not sure. If it is enabled and the service is running as Roger advised to check or you can not enable it look and see if there are any error/warnings that may be related in the application or system logs. ---

http://www.petri.co.il/enable_rdp_windows_2003.htm

To enable the RDP service on Windows Server 2003 follow the next steps:

- 1.. Go to Control Panel.
- 2.. Click System.
- 3.. Go to the Remote tab.
- 4.. Select the "Allow users to connect remotely to this computer" box.

I have just installed the latest security updates on my windows 2003 server. The server has installed exchange 2003. I have rebooted after installing the updates but I can no longer remote desktop to the server anymore. Everything else on the server is working fine. I was able to remote desktop before I installed the updates.

I have checked and there is no windows firewall running on the server. All other services are running fine.

I used the netstat command and cant find the port 3389 listed as listening, so I think this port has been closed.
What can i do to get RDP working or opening up this port.
