I have a typical problem. As per my companies internal policy, No user must connect to Internet (through dialup) when he /she is connected on companies LAN.

The problem is, many laptop users have internal modem. When they are connected to LAN (using cat5 cable) sometime we noticed some users dialup to the internet and access internet.

We are using Windows 2003 Active directory, I would like know is there any script or GPO settings available to block or disable the LAN port when the users connected to internet using dialup.

This is very urgent requirement, Will be gratefull if someone provide me the solution

Regards  
Rayees
