You want to look at Active Directory delegation to allow a regular user to change passwords on non privileged accounts and add computers to the domain. You can select the container you want to do the delegation on, right click, and select delegate to start the delegation Wizard which will then give you some generic choices or you can select advanced/custom if you need to fine tune permissions for AD object types. The user/group needs the permissions to create computer accounts to add computers to the domain. As far as printers if you are talking about printers on domain computers you can add the users/group to the local administrators or possibly power users group if need be on the domain workstations which can be done with a Group Policy startup script or using Group Policy Restricted Groups if you need to do it for a large number of domain computers. --- Steve

<http://www.windowsecurity.com/articles/Using-Restricted-Groups.html> ---

Group Policy Restricted Groups which has two distinct modes. One will replace/enforce current group membership and one will add to it.

Hello all,

I need to set permissions for users so that they are removed from the domain admins group, but still retain permissions such as having access to change passwords, add printers, and add computers to the domain. We are currently running a Windows 2000 domain in native mode.

Whats the best way to achieve this?

Thanks for your time

Sincerely,

Greg
