- 

I recently updated the security policies on a standalone system (not on a domain but in a workgroup) and have begun to have SCECLI 1202 errors in the application event log. These entries show up everytime the computer policy refreshes.

Sample event text:

Security policies are propagated with warning. 0xd : The data is invalid.  
For best results in resolving this event, log on with a non-administrative account and search <http://support.microsoft.com> for "Troubleshooting Event 1202s".

I have reviewed the options at [eventid.net](http://eventid.net) and other information through google, but everything seems to apply to systems which are on a domain. I can find nothing which deals with standalone systems.

Additionally, I have attempted to set the security template back to the original file, but continue to get the same error. I also have noticed this error in the winlogon.log file:

```
configure current_user\control panel\don't load\timedate.cpl  
warning 3: the system cannot find the path specified.  
error configuring current_user\control panel\don't load\timedate.cpl
```

When I first noticed this error, I removed that setting from the script I was running -- I continue to get the same error.

Thanks for any assistance.

Colleen
