You find the firewall in W2k3 pretty much the same way as you do in XP. I use the network connections view and access using the properties of a network interface, going to the advanced tab. Also, while in the network interface properties, check to make sure the File and Print is checked so that it is enabled.

Dear roger,
When i am giving Ping -a <f&p servernam> i am able to get the correct ip. But i don't find any firewall on the Win2003 file and print server. Please helpme out on the same....

regards,
Chinna

Hi,
I have a 2003 file and print server in my domain environment which is a member server and also i have a win2000 professional. Problem is when i am trying to access win2000 machine from the 2003 file & print server i am able to access but, when i am trying to connect to the file and print server from the 2000 machine i used to get "network path not found"... FYI i am able to ping to the DNS Server....Please try to help me....
