Hi,

I have an issue with file/folder permissions on a share.

I want to allow a group to modify all files within a share, but not any folders.

The 'Create Folders/Append Data' permission seems to be what I am after, but I'd like one of these to be allowed and one denied.

Outside of setting explicit read and create permissions on each folder in the share, is there any other way I can set the permissions?

Thanks

Steve
