Hello Trilix,

Best practise in this case is different for everybody. What will you like to achive? Should users be able to create/delete every folder under the top level?Bbetter think about folders for every branch with special branch groups, so that they only can "destroy" their own folder srtructure and not from another branch, which can happen if you use Authenticated users.

Best regards

myweb

Hi,

Can someone tell me what the best practice is when you need to give all users on the domain modify rights on a network share?

At this moment we have given "Authenticated users" modify rights.

I was thinking of putting "Authenticated users" in a global group and putting that in a domain local group ...

Is this the way to go or am I totally wrong here?

Thanks,  
Jurgen
