Sorry missed a question.

Both are using Win2000 pro. I copied the file over over vpn using ntbackup.exe

What operating systems are involved?
How was the copy done?
When the EFS private key was imported into the account's personal store, did you allow it to be used without prompting?

Hi

I encrypted a folder and copied it to another computer. Then I exported the cert/key to the other computer. On that computer, I imported the

cert/key

into the personal and trusted store for certificates. I am not able to read the file in the folder.

I check the serial # and thumbprint of the both the cert and it tallys.

How do I overcome this issue?

Many thanks in advance
Richard
