I have created a domain account that I want it to be a local administrator on all servers in the domain. I want to do this without adding the user to the local administrators group. Is that possible? Is this something that could be done from the local security policy?

Let me get this right.

You want, for each server, a domain account to be an administrator without being in each server's Administrators group ?

So you want the account to be something (admin), without meeting the essential, minimum necessary and sufficient requirement for it to be that something (i.e. member in Administrators group) ?

That would be sort of like us all being billionaires without having to have a billion, right?
