2003 Small Business Server set up as a terminal server.

This connection has been working for months. All of a sudden, unable to remotely access the server. Had been using Remote Desktop accross a public IP. Getting the following message in the Event Log:

A Demand Dial connection to the remote interface Small Business Broadband Connection on port PPPoE4-0 was successfully initiated but failed to complete successfully because of the following error:

Access was denied because the username and/or password was invalid on the domain. I've checked and even reset all passwords but continue to get this message. Attempted to telnet port 3389 from another pc but can't connect. Shutdown antivirus and disabled all firewalls but still can't connect. Anyone has any idea what could be causing this problem.
