You need to install the issuing CA as an enterprise CA running on Windows Server 2003, Enterprise Edition. You are running Windows Server 2003, Standard Edition. Only enterprise edition can issue certificates based on v2 certificate templates

Hi everyone:

I have installed CA root and CA Subordinate in Windows 2003 (though I have a certification authority in Windows 2000 in the same domain).

Everything works fine. I have duplicate the code signing template so I can customize some properties and use certificates with this template.

The problem is when I try to add the certificate template in the Certification Authority so users can request certificates from this template, my created certificate template is not in the existing templates so nobody can request certificates from this template.

Beside it's curious but the code signing certificate seems to be a certificate template class 1

Any help will be appreciated

Thanks
