Turn on "Audit object access" setting (Computer Configuration–Windows Settings–Security Settings–Local Policies–Audit Policy) on the server where the files are stored physically, and configure Audit settings on Advanced security tab of file/folder. You can add users/groups into audit list in the same way you add them into DACL.

Hi

Can u guys give-me some pointers on how can I implement audit on file access and changes for a specific user?

Regards

Joao Cardoso (MVP dotNET)
