Thanks for your help

In certificate template msc, the only option I see is view object identifiers. I know which object Identifier I want to choose. How do create a new template and add to that template object identifier?

Thanks again

> *If you install a Standalone CA you should get the option for the Client Authentication Certificate. If you install an Enterprise CA you will get a list of currently available templates. To manage templates on win2k3 run the Certificate Template snap-in, either by running mmc and adding the snap-in or by running certtmpl.msc. If you are running an Enterprise CA and you create a new template to make sure you set them to be issued by the CA through the Certificate Server snap-in's Certificate Templates node.*
