Hi everyone,

I know this is a bit of a Linux oriented post but I thought perhaps there was something on the Windows side of things that was preventing this from working.

I have recently installed Suse Linux 9.1 on my new notebook. I would like to be able to login against my Windows 2000 domain. I have installed Samba and I was able to join my Linux box to my domain. I am able to share folders on the Linux box and can browse those folders from my Windows machines. When I am browsing from the Windows machine the Linux box does not prompt me for passwords. It either lets me into a share or says "Access denied" so apparently I am authenticated and the Linux box knows who I am.

When I logout KDM (Linux login manager) displays a list of users from my active directory. If I select one of these users and type the *wrong* password I get a "login failed" message. This seems to confirm to me that the password is in fact being checked against the domain controller.

If I enter the correct password however I get "Xsession: login for DOMAIN\User is disabled".

Thanks for any ideas,

Ken.
