Hardly that's a matter of software version compatibility but rather is a configuration problem.

I'm not very familiar with the Novell SuSE product, but few things come to mind:

- * Check the logs for any trails of the failed login
- * Go to runlevel 3 (as the root, run "init 3") and try to login, see if that works and logs are any different – that step will rule out problems with the X login manager and xok group

Inclusion of the PAM configuration for login would help. Please find some additional info about distributed CIFS authentication at

<http://au1.samba.org/samba/docs/man/Samba-HOWTO-Collection/pam.html#id2581955>
