When you open the auditing tab in the Security dialog of the NTFS permissions in the properties of the storage area of concern, what you find is that you may add whatever you would like, just as if you were adding access permissions. If you add Chuck Read in the auditing settings, then only Read events by account Chuck trigger and audit record. A Delete by Chuck does not and a Read by Sally does not. IOW auditing is controlled by SACLs that are just as fine grained and flexible as the DACLs used for granting and denying permissions on NTFS objects.
