We have been having some problems with a hacker on a new 2003 Server. The server is not behind any type of firewall – it has a direct connection to the Internet.

The following ports appear to be open:

21: FTP  
80: HTTP  
445: Microsoft-DS, SMB over TCP  
1025: network blackjack, System V R3 listener (uucp)  
1026: MSTASK/Remote Login Network Terminal, nterm  
1027:  
1028:  
1030: BBN IAD  
1031: InetInfo, BBN IAD  
1032: InetInfo, BBN IAD  
3306: MySQL  
3389: MS Terminal Server  
13782: VERTIAS NetBackup

The program names are what is being reported to us by a couple of different port scanners.

Of these, we know FTP, HTTP, MySQL, and MS Terminal Server (Remote Desktop) are installed. Veritias NetBackup is also installed.

What I don't know about are 445, 1025–1028, and 1030–1032. Can someone shed some light on what is listening on these ports and why they might need to be open?

FWIW, it appears the hacker is using this box to store files.
