

## What to do with certificates when profile is deleted/recreated?

I have an environment with Win2K3 and XP. I have it configured for auto-enrollment which works fine. But:

It often happens that a user uses a different machine. Since roaming profiles will not be implemented for some time, a new profile for the user.

This new profile does not contain the earlier enrolled certificate.

How should I deal with this situation so the user gets his certificate again. As said, roaming profiles are not an option (yet) further more I want to minimize the user interaction as much as possible.

Thanx for any input on this.

Remco
