You could configure your firewall to block access for port 80/443 to all traffic but your website by it's IP address or addresses. If your firewall can not do that, an ipsec filtering policy can do the same basic thing. You can start with a rule that has a deny filter action and a mirrored filter entry for all IP, add a rule with permit filter action and mirrored filter entries for your subnet for all traffic, and your website IP address for port 80 TCP. ---- Steve
