Hi I am running Microsoft Server 2003 Enterprise Edition on a HP Proliant DL380 G3 Clustered Solution.

After Approving the updates in SUS for Both Nodes i decided to reboot one of the nodes only to find that the Printers Were unavailable (Printers configured on Cluster for failover) after reboot so i uninstalled SP1 and rebooted and the Printers were available again to that node.... I decided to reboot the Active cluster just to confirm the update was at fault only to find that as soon as i moved the active group it failed to start on the Node where i removed Sp1 the MSDTC service failed to start So i had to forcefully power down the Node still running SP1 and manually instate the Shares and bring them online....

After rebooting the Node with SP1 it failed to start the Cluster service but no joy, so i uninstalled the SP1 on the remaining node and rebooted now both are operational

I could not find the security configuration wizard under administrative tools as suggested in the Deployment guide nor was i able to run the Cmd line utility to try and understand what went wrong.

Both Servers are Domain Controllers / File Servers Application Servers (DNS, Cluster DHCP, Print etc)

Servers seem to operate Fine after Uninstalling SP1, Just Curious as to why the Installation Of SP1 Went horribly wrong, Tried the same installation manually by running SP1 Setup from Exe file as opposed to using sus....?

Any Suggestions Welcome
