Hello I have some trouble on a test platform. It is a domain with 3 child domain in one forest. When I try to logon on a domain A member server on domain B, with any account (admin domain, enterprise admin), I receive the message that The local policy does not permit you to logon interactively. The trusted relation are OK. There is a specific GPO applied on each domain. The parameter "log on locally" grant permission to Administrators. Any ideas ? Thanks.
