

Login Interactively

We're running a domain with a Windows 2003 server as the pdc and a Windows 2000 server as the sdc. All of the clients are XP Pro or 2000.

I just enabled group policy so that all of the machines would get automatic updates.

Now when the majority of the users try to login they get "The local policy of this system does not permit you to logon interactively"

If I reboot sometimes it will let them login. Other times logging in as administrator then trying to login as them works.

Some users have no problem logging in.

Is there some setting somewhere that configures this?

I've already given everyone local login rights through the Domain Controller Security Policy, but still get the error.

Thanks
