The reason is that the Web enrollment requests are performed in the security context of the user, not the computer. The computer has enroll permissions and not the user. Even if the user were assigned the Read and Enroll permissions, there is no DNS name in their user account to populate the subject of the certificate.

You must enable the Offline templates or create a v2 template that enables the user to provide the subject in the request. This will allow the user to type the DNS name of the computer and then submit the request from the Web interface (if they have Read and Enroll permissions for the cert and are a local Administrator on the computer to install it in the machine store)
