So I have my offline root CA finally setup and used the CAPolicy.inf file to make sure that the extensions were not included in the cert. My understanding is that I should remove the http and ldap lines from the extensions in the manager and just leave the local path only. A few of the resources that I have checked (white papers, books,etc) say that I should go in and modify these paths to point to something that is reachable for the clients when they get a cert from my ent sub CA. Which one is it?
