- >

This is a hardware question and has nothing to do with security so you should choose a more appropriate group for your question.

Having said that, you need the drivers for the new SCSI controller installed, that's why you're getting the blue screen. You can try putting the drives back in the original server, installing the driver for the new SCSI controller and then moving the drivers. Failing that, you'll need to do a repair installation on the new system.

If this doesn't answer your question, please post follow-ups to a group that is on-topic.
