First off check the ntfs permissions on the root/drive folder to make sure that the everyone group does not have full control. If it does change it to read/list/execute. For the parent data folder give users group read/list permissions and then give each user full control for their folder to see if that helps and verify that only administrator and the user account is included in the ntfs permissions and also check the advanced page for properties/security to check special permissions. When you set permissions on the main security page of a folder that will set security for folder, subfolder, and files as seen in the advanced page where you can see or edit permissions for a user/group and select the apply onto box. --- Steve
