G/Day forum,

I'm looking for a File/Folder encryption solution (aside from EFS) for my Windows 2000 based file server. This is based on one of the requirements of Visa/MasterCards PCI Data Security Standard – <http://snipurl.com/fhzg> .

To achieve compliancy with PCI DSS, we need to imply the following controls on credit card data:

- 1) to encrypt data at a folder level – that is all of the containing folders and files
- 2) to allow for split knowledge of encryption keys and management thereof
- 3) to allow for strong encryption support (algorithms like 3DES, AES, etc)
- 4) a mechanism for automating the encryption process on a daily basis – this is coincide with a backup cycle (no clear text credit card files get backed up onto tape)

Your thoughts on any products that suit my requirements?

Regards,
Steve.
