Hi,

I recently changed the configuration of my server to from the member of a domain to a member of another work group.

I was prompted for a restart, now the issue is that the only login ID i know is that of a login that belongs to a domain and i do not have the administrator password or any other password.

Is there any way i can change the computer back to the domain without knowing the admin password.

I know the domain to which the computer used to belong.

Thanks in advance.

Mobin
