Radius standard ports are 1812 and 1813 for authentication and accounting respectively, it's possible that you might need to use the older ports of 1645 and 1646.

Be sure to use ISA 2003 or later. Previous versions would not proxy authentication requests to a two-factor authentication server. Now it does, and as a plus validates membership in AD first, so if you delete the user in AD, you're done.

HTH,

Nick

At last, two-factor authentication, without the hassle factor

Now open source: <http://sourceforge.net/projects/wikid-twofactor/>

.
