Try booting into Safe Mode to scan for viruses and make sure that your anti virus program is current with definitions as of today from the vendors website. Also scan for spyware in both Safe Mode and regular startup. AdAware SE is a pretty good program for detecting and removing spyware if you currently do not have one and spyware can be a cause of sluggish performance though hopefully no one is internet browsing from a server. Also make sure you are using a properly configured firewall to protect your computer and network and keep current with critical security updates at Windows Updates. You can use the command tasklist /svc to see the services associated with each svchost process to review if unwanted services are running on your server.--- Steve

<http://www.lavasoftusa.com/software/adaware/> --- AdAware SE
<http://www.trendmicro.com/download/dcs.asp> --- link to Trend Micro Sysclean that is an excellent free malware detection and removal program that does not need to be installed on your computer.
