Hi,

I have a domain policy on which i have one corrupted object. This object is Office XP installation package. When i open that group policy and go to User configuration/Software settings/Software installation i don't see that package. But using ADSI edit i found that object in container System/Policies/ID of policie/User/Class store/Package.

When i try to delete it it says The specified directory service or attribute does not exist. How to solve this problem?

Thanks in advance
