Hi.

I used to think that admin shares shouldn't be a threat if the administrator password is secure. But, is there a way to audit or log tries to connect to these shares? I have restricted guessing of passwords to five, but this doesn't apply to connecting to shares. Doesn't this mean, that anyone can use their spare time guessing the password (and account name) without a trace?

What W2k3 functionality depends on admin shares, if any?

Antti
