I have been utilizing some of the ideas presented by Michael Howard at <http://msdn.microsoft.com/library/default.asp?url=/library/en-us/dncode/html/secure11152004.asp> and have some questions regarding the application of SAFER policies via GPO. I have made modifications to the registry settings on my Domain Controllers (all Windows 2003 SP1 boxes running in Native Windows 2003 forest/domain mode) to recognize all five user categories: Disallowed, Untrusted, Restricted, Basic User and Unrestricted.

BTW how did you get the Untrusted and Restricted levels to show up in gpedit?
