Are you experiencing any problems with users being able to access resources or other problems? IMHO if not I would not worry about it as an error one or two times a day as most likely nothing to worry about if everything works fine and you have already done your homework with netdiag and checking EventID.net. The link below is to a Google search on that Event ID where you may find some more info. --- Steve

Hi!

I have upgraded one of my domaincontrollers from Windows 2000 to Windows 2003.

I have still got one domaincontroller that is windows 2000.

The 2003 DC have the FSMO roles, both DC's has the global catalog and running DNS server .

After the upgrade I frequently get error loggings on 3 of my Windows 2003 memberservers.

I get Lsasrv Event ID 40960 and 40961 in the systemlogs one to two times a day.

I tried to restart one of the memberservers and then the logging stopped for a week.

I have installed one new server after the upgrade of the domain, on that server I don't get any

errors. I don't have any Lsasrv errors on my windows 2000 memberservers or the domaincontrollers. I been reading the suggestions on Event id net regarding this error, but no luck when it comes to solving the problem.

I have tried to find the error with netdiag. but every test gets passed.

Has anyone a solution to this problem?

Event Type: Warning

Re: Event ID: 40960 SPNEGO (Negotiator) authentication error

Event Source: LSASRV

Event Category: SPNEGO (Negotiator)

Event ID: 40960

Date: 2006-04-05

Time: 05:59:15

User: N/A

Computer: vidstige

Description:

The Security System detected an authentication error for the server cifs/donald.test.nu. The failure code from authentication protocol Kerberos

was "The attempted logon is invalid. This is either due to a bad username or

authentication information.

(0xc000006d)".
