Hi,

I believe that you will have to change CRL publication interval on your offline root CA. You can do it from GUI or CMD using certutil command.

Technet article:

<http://technet2.microsoft.com/WindowsServer/en/Library/6c9228ed-6a21-45e8-bb67-d66f56276c0c1033.mspx>

Best regards

Dejan

Hi,

I have a two-tier setup at my company with the Root CA stored away in a safe – and an issuing CA online. I have read and followed most of the Microsoft documentation on this subject – and I realize it is quite complex to setup.

Everything is working though – except that every week "CDP Location #1" of the RootCA is expiring. Is there any way to delegate this job to the online CA – or configure any other way so that I won't have to manually fetch the CDP from the offline CA once a week?

Hope you can help.

Best regards,

Janus N. Tøndering
