What is the OS ?

I am not following you as "everything but Full Control" is Modify, and if you look at that by highlighting and editing within the Advanced view you see that this "Modify" for "This folder, subfolders, and files" does not have Delete subfolders and files to begin with.

There are a couple ways to go at what you are after for the second group can be effected a couple of ways. What I find more direct is to use two ACEs. One for Files only granting Modify (it was only that these accounts should not delete folders, right?). The second ACE should be for This folder and subfolders, and you should uncheck Delete (just plain Delete, not Delete subfolders and files)

Hi there.

I can't figure this out. It should work but doesn't. We have a folder called Data on our file server, and a folder in there called Client. All users should be able to make a folder, sub folders and files in the Client folder.

But only three users should be able to modify or delete the folders in the Client folder.

I've made two groups, one with the three users allowed to delete or modify, and one group with everyone else.

The first group gets everything but Full Control.

The second group gets the same, except I go into Special Permissions and remove Delete Subfolders and Files. Users in the second group can still delete subfolders. (Yes I've logged them off and on again between tests).

Any ideas?

Re: special permissions on folder don't work

Thanks, Neal
