I'm sorry, I completely left out the details about the device I am using. My application uses an MPEG decoder card, the "device" in my original post.

By "call[ing] the device API function to open the file" I meant calling the MPEG decoder card API functions mpgLoad and mpgPlay.

I can definitely open the files fine if I open the files using the function ifstream::open but mpgLoad and mpgPlay will not work. This has lead me to the conclusion that the operating system is not decrypting the files for the MPEG decoder card.
