You would have to configure access at the computer level and that could be done in a couple of ways. If you could enable the Windows Firewall on the servers with the shares you could specify the exception for file and print sharing and then the IP addresses that are allowed access to file and print sharing. For that to work well you would want to make sure that the user are not local administrators on their computers and that the IPs in the allowed list are static IPs. The other way would be to use ipsec to have an ipsec require policy on the servers with the shares for at least the ports used for file and print sharing and then making sure only the computers you want to have access have a compatible ipsec policy and that the XP Pro computers do not. Ipsec is a somewhat complex topic that requires a lot of planning, testing, and special considerations for domain controllers. See the links below if interested. --- Steve

How to configure Domain access permissions for a user that would vary based on the computer they log into?

I have a server farm consisting of all windows 2003 servers with R2

All my workstations are Windows XP professional with SP2

What I would like is to be able to limit my users access to domain shares (specifically DFS shares) so that these shares are only accessible while they are logged into and using one of the Terminal Servers.

I do not want these shares accessible from the XP Pro workstations.

Re: How to configure Domain access permissions for a user that would vary based on the computer they log

Re: How to configure Domain access permissions for a user that would vary based on the computer they log into?

I would like to keep the XP Pro workstations on the domain so i can implement some GPOs.

I really do not want to limit the XP systems networking (so users can still do in-office printer sharing, etc) with Group Policies and I would prefer to have the user use their same login and password for both the XP and Terminal Server logins.

Does anyone know of any way to achieve this?

Thanks
